# Which Framework / Library?

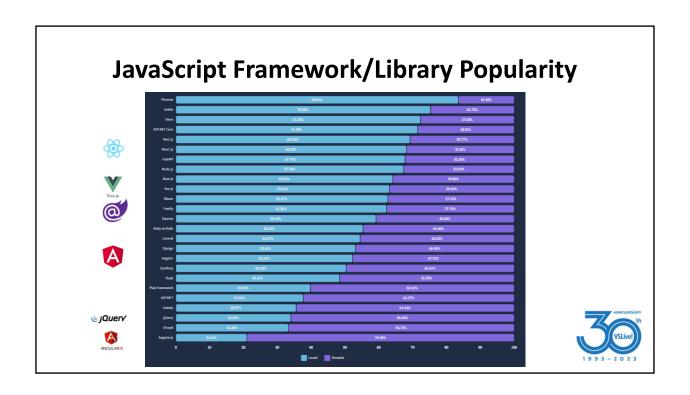

- 3 *main* choices today
  - React, Angular, Vue
- Company and Team DNA
- Evaluate / investigate at a 30k level
- Performance
- Community adoption
- · Company backing
- Feature comparison
- Personal preference / subjective opinions
- Surveys are mixed...

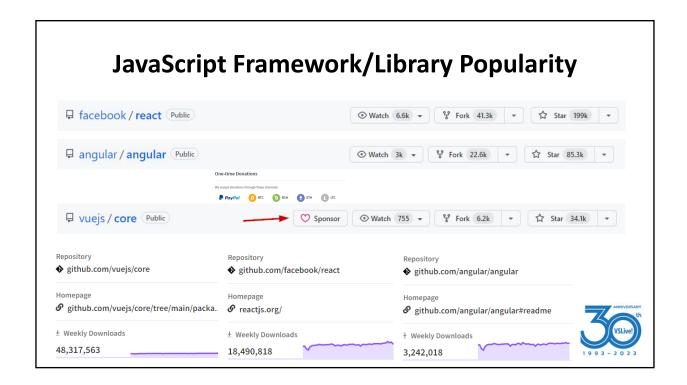

- View library focused on component creation / reusable elements
- 10 years tenure
- · Wide community and enterprise adoption
- Rich ecosystem
- Excellent choice for seasoned JS teams
- Everything is JavaScript: JSX, CSS-in-JS
- CLI: create-react-app
- Leverage core React knowledge for mobile apps
- Developed and maintained by Meta

- Complete framework for building modern web/Single Page Apps
- 12+ years tenure
- · Wide community and enterprise adoption
- All-inclusive benefits that come with a framework
- Built using TypeScript
- HTML Templates
- Some dotted-line concepts to server-side MVC development
- CLI: Angular CLI
- Developed and maintained by Google

- Framework for creating components
- Core library >> view layer only
- Companion libraries officially supported by core team
- 9 years tenure
- Grassroots popularity
- Less adoption in the enterprise
- Best of Angular + React
- Out of the box: HTML Templates
- v3.0 rewritten from the ground up in TypeScript
- Lacking major financial backing
- Remember Aurelia?

#### **Framework Advantages**

- · Frameworks can aid in the following
  - All-inclusive benefits
  - Focus on writing code instead of juggling decisions
  - Data-binding
  - DI
  - Routing
  - Testability
  - SoC
  - Modular
  - Security
  - Support
  - Overall efficiency getting up and running

#### **View/Component Library Advantages**

- Less opinionated / more flexible
- More control over the architecture/implementation behavior
- · Focus on doing one thing well; making reusable components
- · Segregated API surface area
- Mix and match
- Composable application
- Cherry-pick the tailored solution
  - Router
  - State management
  - Http
  - Type Checking
  - Build System
- "If you don't choose a framework, you'll end up building one"

#### Web Assembly

- The reality is... a lot of people don't like JavaScript
  - There is excitement brewing for this part of the community

- A new option exists for modern web development
  - This might dilute some JS development in the future

### **Web Assembly**

- Compiled code for the web browser
- Native part and supported by all major browsers
- Compile C# to WASM bytecode that runs in the browser
- No plugin required (Silverlight, Flash)
- Runs inside the browser sandbox alongside JS

- Same code client & server (C#)
- Performant due to being machine code vs. human code (.js)
  - Runs at near native speeds | https://webassembly.org

# **Blazor**

- Open-source framework from Microsoft
- Part of ASP.NET
- Ability to create modern web applications using C#, HTML, CSS
- Use C# in favor of JavaScript\*
- Leverages WebAssembly = Performance
- Use .NET/C# skills for the entire stack

- 5 years strong | <a href="https://blazor.net">https://blazor.net</a>
- Increased adoption
- Client & Server-Side hosting models
  - Blazor WebAssembly (WASM)
  - Blazor Server
- Included in .NET 6
- Based on web components (.razor views)
- Component libraries: https://blazorise.com/

### **Keeping up with changes**

- Web technology is ever evolving
- New technology choices: overwhelming
- Keep stock in logic on the server
- Focus on architecture and patterns
- Stay informed but don't overreact

## Thank you! Q&A
